WebDrive Enhances Konect Serverware Solution Capabilities

Annapolis, MD – May 24, 2005 – South River Technologies (SRT) announced today that it has entered into an OEM partnership with Canada based desktopsites Inc. to license its WebDrive product. WebDrive allows users, through a mapped drive letter, to securely access remote files as if they were on their local computer.

Targeting small to medium sized businesses, desktopsites' Konect is a serverware solution that allows businesses to centrally manage and deploy networked resources to their users. Konect seamlessly integrates and delivers server-based applications, networked files, and web services to employee computers in a highly secure environment without a terminal server desktop session. The delivery of these services is done through a normal desktop environment, relieving the demands placed on administrators by traditional terminal server desktop delivery.

WebDrive greatly enhances the functionality of the Konect serverware application by dynamically configuring a drive letter within the local pc that provides the transport mechanism (via http / https) that Konect users utilize to access local area network (LAN) files both in and out of the workplace.

“WebDrive is a true compliment to our Konect serverware solution” says Alex Bethlehem, President and CEO of desktopsites. “By integrating WebDrive into Konect, we are able to deliver a powerful customer solution that allows users to access network files as easily as local files. One of our primary objectives in developing Konect was to

deliver a simplified server-based computing environment that supports remote and mobile workers as easily as local users. WebDrive provides a key component of the Konect solution that delivers on this objective.”

About desktopsites
